## MATHEMATICS

Unit Mechanics 5

Tuesday 26 June 20071.30 pm to 3.00 pm

For this paper you must have:

- an 8-page answer book
- the blue AQA booklet of formulae and statistical tables.

You may use a graphics calculator.

Time allowed: 1 hour 30 minutes

## Instructions

- Use blue or black ink or ball-point pen. Pencil should only be used for drawing.
- Write the information required on the front of your answer book. The Examining Body for this paper is AQA. The Paper Reference is MM05.
- Answer all questions.
- Show all necessary working; otherwise marks for method may be lost.
- The final answer to questions requiring the use of calculators should be given to three significant figures, unless stated otherwise.
- Take $g=9.8 \mathrm{~m} \mathrm{~s}^{-2}$, unless stated otherwise.

## Information

- The maximum mark for this paper is 75 .
- The marks for questions are shown in brackets.

## Advice

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.

## Answer all questions.

1 A particle moves with simple harmonic motion along a straight line. Its maximum speed is $4 \mathrm{~m} \mathrm{~s}^{-1}$ and its maximum acceleration is $100 \mathrm{~m} \mathrm{~s}^{-2}$.
(a) Show that the period of motion is $\frac{2 \pi}{25}$ seconds.
(b) Find the amplitude of the motion.

2 A simple pendulum consists of a particle, of mass $m$, fixed to one end of a light, inextensible string of length $l$. The other end of the string is attached to a fixed point. When the pendulum is in motion, the angle between the string and the downward vertical is $\theta$ at time $t$. The motion takes place in a vertical plane.
(a) Show, using a trigonometrical approximation, that for small angles of oscillation the motion of the pendulum can be modelled by the differential equation

$$
\begin{equation*}
\frac{\mathrm{d}^{2} \theta}{\mathrm{~d} t^{2}}=-\frac{g}{l} \theta \tag{4marks}
\end{equation*}
$$

(b) The pendulum has length 0.5 metres. The pendulum is released from rest with the string taut and at an angle of $\frac{\pi}{400}$ to the vertical.
(i) Given that $\theta=A \cos \omega t$, find the values of $A$ and $\omega$.
(ii) Find the maximum speed of the particle in the subsequent motion.

3 A uniform rod, $O A$, of length $3 a$ and mass $2 m$, is freely pivoted at $O$. A light, inextensible string, of length $10 a$, is attached to the rod at $A$ and passes over a fixed, smooth peg at $B$, a distance $3 a$ vertically above $O$. A particle, $P$, of mass $m$, is attached to the other end of the string. The angle between the rod and the vertical is $2 \theta$, as shown in the diagram.

(a) Show that the total potential energy of the system, $V$, is given by

$$
V=6 m g a \cos \theta-7 m g a-3 m g a \cos 2 \theta
$$

where gravitational potential energy is taken to be zero at $O$.
(b) Find the two values of $\theta, 0 \leqslant \theta<\frac{\pi}{2}$, for which the system is in equilibrium. (6 marks)
(c) Determine the stability of each position of equilibrium.

4 A particle of mass $m$ is moving along a smooth wire that is fixed in a plane. The polar equation of the wire is $r=a \mathrm{e}^{3 \theta}$. The particle moves with a constant angular velocity of 6 .

At time $t=0$, the particle is at the point with polar coordinates $(a, 0)$.
(a) Find the transverse and radial components of the acceleration of the particle in terms of $a$ and $t$.
(b) The resultant force on the particle is $\mathbf{F}$.

Show that the magnitude of $\mathbf{F}$, at time $t$, is $360 \mathrm{mae}^{18 t}$.

5 The ends of a light, uniform elastic string are fixed to two points, $A$ and $B$, a distance $9 a$ apart on a smooth, horizontal plane. The string is of natural length $6 a$ and modulus of elasticity $4 m n^{2} a$, where $n$ is a constant.

A particle of mass $m$ is attached to the string at $P$, where $A P=6 a$. The natural length of $A P$ is $4 a$ and the natural length of $B P$ is $2 a$. In this position, the particle is in equilibrium.

The particle is moved a distance $\frac{1}{2} a$ towards $B$ and then released from rest at time $t=0$. The displacement of the particle from its equilibrium position at time $t$ is $x$. Hence initially $x=+\frac{1}{2} a$.

The motion of the particle is resisted by a force of magnitude $2 m n v$, where $v$ is the speed of the particle at time $t$.
(a) Show that $x$ satisfies

$$
\begin{equation*}
\frac{\mathrm{d}^{2} x}{\mathrm{~d} t^{2}}+2 n \frac{\mathrm{~d} x}{\mathrm{~d} t}+3 n^{2} x=0 \tag{7marks}
\end{equation*}
$$

(b) Given that $n=1$, find $x$ in terms of $a$ and $t$.

6 A large snowball, which may be modelled as a uniform sphere of radius $r$, moves with speed $v$ down a slope inclined at $30^{\circ}$ to the horizontal. The snowball picks up snow at a rate proportional to both its speed and its mass, $m$, and hence it may be assumed that $\frac{\mathrm{d} m}{\mathrm{~d} t}=k m v$ at time $t$, where $k$ is a constant.

You should ignore any rotational motion of the snowball.
(a) Neglecting any resistance forces acting on the snowball, show that

$$
\begin{equation*}
2 \frac{\mathrm{~d} v}{\mathrm{~d} t}+2 k v^{2}=g \tag{4marks}
\end{equation*}
$$

(b) Using the identity

$$
\frac{\mathrm{d} v}{\mathrm{~d} t}=\frac{\mathrm{d} x}{\mathrm{~d} t} \times \frac{\mathrm{d} v}{\mathrm{~d} x}=v \frac{\mathrm{~d} v}{\mathrm{~d} x}
$$

where $x$ is the distance travelled by the centre of the snowball, show that the differential equation in part (a) can be written as

$$
2 v \frac{\mathrm{~d} v}{\mathrm{~d} x}=g-2 k v^{2}
$$

(c) At time $t=0, v=0$ and $x=0$.

Solve the differential equation in part (b) to find $v^{2}$ as a function of $x$.
(d) When $t=0, v=0$ and $x=0$, the radius of the snowball is $\frac{1}{3}$ metre.
(i) Show that $r^{3}=C \mathrm{e}^{k x}$, where $C$ is a constant to be determined.
(ii) Find, in terms of $g$ and $k$, the speed of the snowball when its radius is 1 metre.
(2 marks)

## END OF QUESTIONS
