OCR (Oxford Cambridge and RSA) is a leading UK awarding body, providing a wide range of qualifications to meet the needs of pupils of all ages and abilities. OCR qualifications include AS/A Levels, GCSEs, OCR Nationals, Key Skills, Entry Level qualifications, NVQs and vocational qualifications in areas such as IT, business, languages, teaching/training, administration and secretarial skills.

It is also responsible for developing new syllabuses to meet national requirements and the needs of students and teachers. OCR is a not-for-profit organisation; any surplus made is invested back into the establishment to help towards the development of qualifications and support which keep pace with the changing needs of today's society.

This mark scheme is published as an aid to teachers and students, to indicate the requirements of the examination. It shows the basis on which marks were awarded by Examiners. It does not indicate the details of the discussions which took place at an Examiners' meeting before marking commenced.

All Examiners are instructed that alternative correct answers and unexpected approaches in candidates' scripts must be given marks that fairly reflect the relevant knowledge and skills demonstrated.

Mark schemes should be read in conjunction with the published question papers and the Report on the Examination.

OCR will not enter into any discussion or correspondence in connection with this mark scheme.

(vi)	 <p>$6p - 4 = 1 - 2p \Rightarrow p = \frac{5}{8}$</p>	B1 M1 A1	Their lines drawn correctly on a reasonable scale Solving the correct pair of equations or using graph correctly $\frac{5}{8}$, 0.625, cao	[3]																																		
(vii)	Add 4 throughout matrix to make all values non-negative On this augmented matrix, if Collies play X Rovers expect $6p_1 + 5p_2$; if Collies play Y Rovers expect $3p_1 + p_2 + 5p_3$; and if Collies play Z Rovers expect $7p_1 + 3p_2 + 4p_3$ We want to maximise M where M only differs by a constant from m and, for each value of p , m is the minimum expected value.	B1 B1 B1	'Add 4', or new matrix written out or equivalent Relating to columns X , Y and Z respectively. Note: expressions are given in the question. For each value of p we look at the minimum output, then we maximise these minima.	[3]																																		
(viii)	$p_3 = \frac{3}{8}$ $M = -\frac{1}{4}$	B1 B1	cao cao	[2]

4 (i)	$8+0+6+5+4$ $= 23$ gallons per minute	M1 A1	$8+0+6+5+4$ or 23 23 with units	[2]
(ii)	At most 6 gallons per minute can enter A so there cannot be 7 gallons per minute leaving it At most 7 gallons per minute can leave F so there cannot be 10 gallons per minute entering it.	B1 B1	Maximum into $A = 6$ Maximum out of $F = 7$	[2]
(iii)	A diagram showing a flow with 12 through E Flow is feasible (upper capacities not exceeded) Nothing flows through A and D Maximum flow through $E = 12$ gallons per minute	M1 M1 A1 B1	Assume that blanks mean 0 12	[4]
(iv) a	If flows through A but not D its route must be $S - A - C - E$, but the flow through E is already a maximum	B1	A correct explanation	[1]
b	$S - (B) - C - D - F - T$ 1 gallon per minute	M1 A1	Follow through their part (iii) 1	[2]
(v)	Flow = $12 + 1 = 13$ gallons per minute Cut through ET and FT or $\{S,A,B,C,D,E,F\}$, $\{T\}$ $= 13$ gallons per minute Every cut forms a restriction Every cut \geq every flow \square min cut \geq max flow This cut = this flow so must be min cut and max flow	B1 M1 A1 B1	Identifying this cut in any way Use of max flow – min cut theorem min cut \geq max flow This cut = this flow (or having shown that both are 13)	[4]
(vi)	3 gallons per minute Must flow 6 along ET and 7 along FT . Can send 4 into F from D so only need to send 9 through E	B1 B1 B1	3 A correct explanation	[3]
(vii)	A diagram showing a flow of 13 without using BE Flow is feasible and only sends 9 through E	M1 A1	May imply directions and assume that blanks mean 0	[2]
