Mechanics 3

**4730**

Candidates answer on the Answer Booklet

**OCR Supplied Materials:**

- 8 page Answer Booklet
- List of Formulae (MF1)

**Other Materials Required:**

None

**Thursday 11 June 2009**  
**Morning**

**Duration:** 1 hour 30 minutes

**INSTRUCTIONS TO CANDIDATES**

- Write your name clearly in capital letters, your Centre Number and Candidate Number in the spaces provided on the Answer Booklet.
- Use black ink. Pencil may be used for graphs and diagrams only.
- Read each question carefully and make sure that you know what you have to do before starting your answer.
- Answer **all** the questions.
- Do **not** write in the bar codes.
- Give non-exact numerical answers correct to 3 significant figures unless a different degree of accuracy is specified in the question or is clearly appropriate.
- The acceleration due to gravity is denoted by  $g \text{ m s}^{-2}$ . Unless otherwise instructed, when a numerical value is needed, use  $g = 9.8$ .
- You are permitted to use a graphical calculator in this paper.

**INFORMATION FOR CANDIDATES**

- The number of marks is given in brackets [ ] at the end of each question or part question.
- **You are reminded of the need for clear presentation in your answers.**
- The total number of marks for this paper is **72**.
- This document consists of **8** pages. Any blank pages are indicated.

- 1 A smooth sphere of mass  $0.3 \text{ kg}$  bounces on a fixed horizontal surface. Immediately before the sphere bounces the components of its velocity horizontally and vertically downwards are  $4 \text{ m s}^{-1}$  and  $6 \text{ m s}^{-1}$  respectively. The speed of the sphere immediately after it bounces is  $5 \text{ m s}^{-1}$ .

- (i) Show that the vertical component of the velocity of the sphere immediately after impact is  $3 \text{ m s}^{-1}$ , and hence find the coefficient of restitution between the surface and the sphere. [3]
- (ii) State the direction of the impulse on the sphere and find its magnitude. [3]

2

Two uniform rods,  $AB$  and  $BC$ , are freely jointed to each other at  $B$ , and  $C$  is freely jointed to a fixed point. The rods are in equilibrium in a vertical plane with  $A$  resting on a rough horizontal surface. This surface is  $1.5 \text{ m}$  below the level of  $B$  and the horizontal distance between  $A$  and  $B$  is  $3 \text{ m}$  (see diagram). The weight of  $AB$  is  $80 \text{ N}$  and the frictional force acting on  $AB$  at  $A$  is  $14 \text{ N}$ .

- (i) Write down the horizontal component of the force acting on  $AB$  at  $B$  and show that the vertical component of this force is  $33 \text{ N}$  upwards. [4]
- (ii) Given that the force acting on  $BC$  at  $C$  has magnitude  $50 \text{ N}$ , find the weight of  $BC$ . [4]

3

Two uniform smooth spheres  $A$  and  $B$ , of equal radius, have masses  $4 \text{ kg}$  and  $2 \text{ kg}$  respectively. They are moving on a horizontal surface when they collide. Immediately before the collision both spheres have speed  $3 \text{ m s}^{-1}$ . The spheres are moving in opposite directions, each at  $60^\circ$  to the line of centres (see diagram). After the collision  $A$  moves in a direction perpendicular to the line of centres.

- (i) Show that the speed of  $B$  is unchanged as a result of the collision, and find the angle that the new direction of motion of  $B$  makes with the line of centres. [8]
- (ii) Find the coefficient of restitution between the spheres. [2]

- 4 A motor-cycle, whose mass including the rider is 120 kg, is decelerating on a horizontal straight road. The motor-cycle passes a point  $A$  with speed  $40 \text{ m s}^{-1}$  and when it has travelled a distance of  $x \text{ m}$  beyond  $A$  its speed is  $v \text{ m s}^{-1}$ . The engine develops a constant power of 8 kW and resistances are modelled by a force of  $0.25v^2 \text{ N}$  opposing the motion.

(i) Show that  $\frac{480v^2}{v^3 - 32000} \frac{dv}{dx} = -1$ . [5]

- (ii) Find the speed of the motor-cycle when it has travelled 500 m beyond  $A$ . [6]

5

Each of two identical strings has natural length 1.5 m and modulus of elasticity 18 N. One end of one of the strings is attached to  $A$  and one end of the other string is attached to  $B$ , where  $A$  and  $B$  are fixed points which are 3 m apart and at the same horizontal level.  $M$  is the mid-point of  $AB$ . A particle  $P$  of mass  $m \text{ kg}$  is attached to the other end of each of the strings.  $P$  is held at rest at the point 0.8 m vertically above  $M$ , and then released. The lowest point reached by  $P$  in the subsequent motion is 2 m below  $M$  (see diagram).

- (i) Find the maximum tension in each of the strings during  $P$ 's motion. [3]

(ii) By considering energy,

- (a) show that the value of  $m$  is 0.42, correct to 2 significant figures, [5]

- (b) find the speed of  $P$  at  $M$ . [3]

6

A particle  $P$  of mass  $m$  kg is attached to one end of a light inextensible string of length  $L$  m. The other end of the string is attached to a fixed point  $O$ . The particle is held at rest with the string taut and then released.  $P$  starts to move and in the subsequent motion the angular displacement of  $OP$ , at time  $t$  s, is  $\theta$  radians from the downward vertical (see diagram). The initial value of  $\theta$  is 0.05.

(i) Show that  $\frac{d^2\theta}{dt^2} = -\frac{g}{L} \sin \theta$ . [2]

(ii) Hence show that the motion of  $P$  is approximately simple harmonic. [2]

(iii) Given that the period of the approximate simple harmonic motion is  $\frac{4}{7}\pi$  s, find the value of  $L$ . [2]

(iv) Find the value of  $\theta$  when  $t = 0.7$  s, and the value of  $t$  when  $\theta$  next takes this value. [4]

(v) Find the speed of  $P$  when  $t = 0.7$  s. [3]

7

A hollow cylinder has internal radius  $a$ . The cylinder is fixed with its axis horizontal. A particle  $P$  of mass  $m$  is at rest in contact with the smooth inner surface of the cylinder.  $P$  is given a horizontal velocity  $u$ , in a vertical plane perpendicular to the axis of the cylinder, and begins to move in a vertical circle. While  $P$  remains in contact with the surface,  $OP$  makes an angle  $\theta$  with the downward vertical, where  $O$  is the centre of the circle. The speed of  $P$  is  $v$  and the magnitude of the force exerted on  $P$  by the surface is  $R$  (see diagram).

(i) Find  $v^2$  in terms of  $u$ ,  $a$ ,  $g$  and  $\theta$  and show that  $R = \frac{mu^2}{a} + mg(3 \cos \theta - 2)$ . [7]

(ii) Given that  $P$  just reaches the highest point of the circle, find  $u^2$  in terms of  $a$  and  $g$ , and show that in this case the least value of  $v^2$  is  $ag$ . [4]

(iii) Given instead that  $P$  oscillates between  $\theta = \pm\frac{1}{6}\pi$  radians, find  $u^2$  in terms of  $a$  and  $g$ . [2]
