Wednesday

21 JUNE 2006

Afternoon

1 hour 30 minutes

Additional materials: 8 page answer booklet Graph paper List of Formulae (MF1)

TIME 1 hour 30 minutes

## INSTRUCTIONS TO CANDIDATES

- Write your name, centre number and candidate number in the spaces provided on the answer booklet.
- Answer all the questions.
- Give non-exact numerical answers correct to 3 significant figures unless a different degree of accuracy is specified in the question or is clearly appropriate.
- The acceleration due to gravity is denoted by  $g \, \text{m s}^{-2}$ . Unless otherwise instructed, when a numerical value is needed, use g = 9.8.
- You are permitted to use a graphical calculator in this paper.

## INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is 72.
- Questions carrying smaller numbers of marks are printed earlier in the paper, and questions carrying larger numbers of marks later in the paper.
- You are reminded of the need for clear presentation in your answers.

- MM. Mynainsch
- A straight rod AB of length a has variable density. At a distance x from A its mass per unit length is k(a+2x), where k is a positive constant. Find the distance from A of the centre of mass of the rod.

[5]

- A flywheel takes the form of a uniform disc of mass 8 kg and radius 0.15 m. It rotates freely about an axis passing through its centre and perpendicular to the disc. A couple of constant moment is applied to the flywheel. The flywheel turns through an angle of 75 radians while its angular speed increases from 10 rad s<sup>-1</sup> to 25 rad s<sup>-1</sup>.
  - (i) Find the moment of the couple about the axis.

[5]

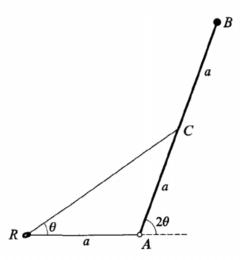

When the flywheel is rotating with angular speed  $25 \, \text{rad s}^{-1}$ , it locks together with a second flywheel which is mounted on the same axis and is at rest. Immediately afterwards, both flywheels rotate together with the same angular speed  $9 \, \text{rad s}^{-1}$ .

(ii) Find the moment of inertia of the second flywheel about the axis.

[3]

3 The region bounded by the x-axis, the lines x = 1 and x = 2 and the curve  $y = \frac{1}{x^2}$  for  $1 \le x \le 2$ , is occupied by a uniform lamina of mass 24 kg. The unit of length is the metre. Find the moment of inertia of this lamina about the x-axis.

4

A uniform rod AB, of mass m and length 2a, is freely hinged to a fixed point at A. A particle of mass 2m is attached to the rod at B. A light elastic string, with natural length a and modulus of elasticity 5mg, passes through a fixed smooth ring R. One end of the string is fixed to A and the other end is fixed to the mid-point C of AB. The ring R is at the same horizontal level as A, and is at a distance a from A. The rod AB and the ring R are in a vertical plane, and RC is at an angle  $\theta$  above the horizontal, where  $0 < \theta < \frac{1}{4}\pi$ , so that the acute angle between AB and the horizontal is  $2\theta$  (see diagram).

(i) By considering the energy of the system, find the value of  $\theta$  for which the system is in equilibrium.

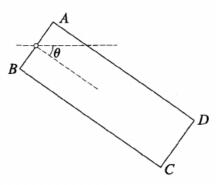

[7]

(ii) Determine whether this position of equilibrium is stable or unstable.

[3]

- 1.8 m.

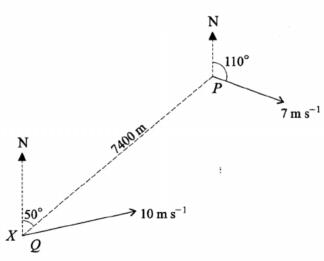

- A uniform rectangular lamina ABCD has mass 20 kg and sides of lengths AB = 0.6 m and BC = 1.8 m. It rotates in its own vertical plane about a fixed horizontal axis which is perpendicular to the lamina and passes through the mid-point of AB.
  - (i) Show that the moment of inertia of the lamina about the axis is  $22.2 \,\mathrm{kg} \,\mathrm{m}^2$ . [3]

The lamina is released from rest with BC horizontal and below the level of the axis. Air resistance may be neglected, but a frictional couple opposes the motion. The couple has constant moment 44.1 N m about the axis. The angle through which the lamina has turned is denoted by  $\theta$  (see diagram).

- (ii) Show that the angular acceleration is zero when  $\cos \theta = 0.25$ .
- (iii) Hence find the maximum angular speed of the lamina. [5]

6

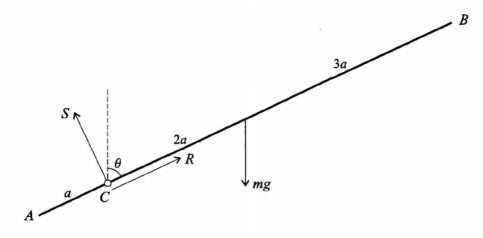

A ship P is moving with constant velocity  $7 \,\mathrm{m\,s^{-1}}$  in the direction with bearing  $110^\circ$ . A second ship Q is moving with constant speed  $10 \,\mathrm{m\,s^{-1}}$  in a straight line. At one instant Q is at the point X, and P is  $7400 \,\mathrm{m}$  from Q on a bearing of  $050^\circ$  (see diagram). In the subsequent motion, the shortest distance between P and Q is  $1790 \,\mathrm{m}$ .

(i) Show that one possible direction for the velocity of Q relative to P has bearing  $036^{\circ}$ , to the nearest degree, and find the bearing of the other possible direction of this relative velocity. [3]

Given that the velocity of Q relative to P has bearing 036°, find

- (ii) the bearing of the direction in which Q is moving, [4]
- (iii) the magnitude of the velocity of Q relative to P, [2]
- (iv) the time taken for Q to travel from X to the position where the two ships are closest together, [3]
- (v) the bearing of P from Q when the two ships are closest together. [1]

[Turn over

A uniform rod AB has mass m and length 6a. It is free to rotate in a vertical plane about a smooth fixed horizontal axis passing through the point C on the rod, where AC = a. The angle between AB and the upward vertical is  $\theta$ , and the force acting on the rod at C has components R parallel to AB and S perpendicular to AB (see diagram). The rod is released from rest in the position where  $\theta = \frac{1}{3}\pi$ . Air resistance may be neglected.

- (i) Find the angular acceleration of the rod in terms of a, g and  $\theta$ . [4]
- (ii) Show that the angular speed of the rod is  $\sqrt{\frac{2g(1-2\cos\theta)}{7a}}$ . [3]
- (iii) Find R and S in terms of m, g and  $\theta$ . [6]
- (iv) When  $\cos \theta = \frac{1}{3}$ , show that the force acting on the rod at C is vertical, and find its magnitude.
