

## Poisson distributions 2G

- 1 a i  $P(X = 4) = \binom{100}{4} \times (0.05)^4 \times (0.95)^{96} = 0.1781$  (4 d.p.)
- ii Using a calculator:  
 $P(X \leq 2) = 0.1183$  (4 d.p.)
- b Use the approximation  $X \sim \text{Po}(100 \times 0.05)$ , i.e.  $X \sim \text{Po}(5)$
- i  $P(X = 4) = \frac{e^{-5} 5^4}{4!} = 0.1755$  (4 d.p.)
- ii Using the tables on page 191 of the textbook:  
 $P(X \leq 2) = 0.1247$
- 2 a i  $P(X = 5) = \binom{150}{5} \times (0.04)^5 \times (0.96)^{145} = 0.1628$  (4 d.p.)
- ii Using a calculator:  
 $P(X \leq 3) = 0.1458$  (4 d.p.)
- b Use the approximation  $X \sim \text{Po}(150 \times 0.04)$ , i.e.  $X \sim \text{Po}(6)$
- i  $P(X = 5) = \frac{e^{-6} 6^5}{5!} = 0.1606$  (4 d.p.)
- ii Using the tables in the textbook:  
 $P(X \leq 3) = 0.1512$
- 3 a Let  $X = 200 - Y$  so that  $X \sim \text{B}(200, 0.02)$
- i  $P(Y = 197) = P(X = 3) = \binom{200}{3} \times (0.02)^3 \times (0.98)^{197} = 0.1963$  (4 d.p.)
- ii Using a calculator:  
 $P(Y \geq 198) = P(X \leq 2) = 0.2351$  (4 d.p.)
- b Use the approximation  $X \sim \text{Po}(200 \times 0.02)$ , i.e.  $X \sim \text{Po}(4)$
- i  $P(X = 3) = \frac{e^{-4} 4^3}{3!} = 0.1954$  (4 d.p.)
- ii Using the tables in the textbook:  
 $P(X \leq 2) = 0.2381$
- 4 Let  $X$  be the number of pupils with a birthday on 1 April, assuming a uniform distribution of birthdays across 365 days of the year.
- Then  $X \sim \text{B}\left(800, \frac{1}{365}\right)$
- a  $P(X = 4) = \binom{800}{4} \times \left(\frac{1}{365}\right)^4 \times \left(\frac{364}{365}\right)^{796} = 0.1075$  (4 d.p.)
- b Use the approximation  $X \sim \text{Po}\left(800 \times \frac{1}{365}\right)$ , i.e.  $X \sim \text{Po}\left(\frac{160}{73}\right)$
- $P(X = 4) = \frac{e^{-\frac{160}{73}} \left(\frac{160}{73}\right)^4}{4!} = 0.1074$  (4 d.p.)

- 4 c** The two answers are very similar, which shows that the Poisson approximation is a good approximation in this case. This is to be expected as the Poisson approximation is extremely accurate for this very low value  $p$  and high  $n$ .
- 5** Let  $X$  be the number of defective items in a batch of 100. Then  $X \sim B(100, 0.03)$  and this can be approximated by  $X \sim \text{Po}(100 \times 0.03)$ , i.e.  $X \sim \text{Po}(3)$
- a** Using the tables in the textbook:  
 $P(X \leq 3) = 0.6472$
- b**  $P(X = 2) = \frac{e^{-3} 3^2}{2!} = 0.2240$  (4 d.p.)
- 6** Let  $X$  be the number of patients with the condition in a sample of 180. Then  $X \sim B(180, 0.02)$  and this can be approximated by  $X \sim \text{Po}(180 \times 0.02)$ , i.e.  $X \sim \text{Po}(3.6)$
- a**  $P(X = 1) = \frac{e^{-3.6} 3.6^1}{1!} = 0.0984$  (4 d.p.)
- b** As  $\lambda = 3.6$  use a calculator to find the required value:  
 $P(X \geq 2) = 1 - P(X \leq 1)$   
 $= 1 - 0.1257 = 0.8743$  (4 d.p.)
- 7 a** Let  $X$  be the number of people who catch the virus in a sample of 20. Then  $X \sim B\left(20, \frac{1}{120}\right)$
- $$P(X = 1) = \binom{20}{1} \left(\frac{1}{120}\right)^1 \left(\frac{119}{120}\right)^{19} = 0.1422$$
- (4 d.p.)
- b** Let  $Y$  be the number of people who catch the virus in a sample of 900.  
 Then  $Y \sim B\left(900, \frac{1}{120}\right)$  and this can be approximated by  $Y \sim \text{Po}(7.5)$   
 Using the tables in the textbook:  
 $P(Y \leq 6) = 0.3782$
- 8 a** Let  $X$  be the number of defective articles in a sample of 10. Then  $X \sim B(10, 0.025)$
- $$P(X = 1) = \binom{10}{1} (0.025)^1 (0.975)^9 = 0.1991$$
- (4 d.p.)
- b** Let  $Y$  be the number of defective articles in a sample of 120. Then  $Y \sim B(120, 0.025)$  and this can be approximated by  $Y \sim \text{Po}(120 \times 0.025)$ , i.e.  $Y \sim \text{Po}(3)$   
 Using the tables in the textbook:  
 $P(Y \leq 3) = 0.6472$
- 9 a** Let  $X$  be the number of chipped pots in a sample of 10. Then  $X \sim B(10, 0.05)$
- b**  $P(X = 3) = \binom{10}{3} (0.05)^3 (0.95)^7 = 0.0105$  (4 d.p.)

- 9 c** Let  $Y$  be the number of chipped pots in a sample of 140. Then  $Y \sim B(140, 0.05)$  and this can be approximated by  $Y \sim \text{Po}(140 \times 0.05)$ , i.e.  $Y \sim \text{Po}(7)$   
 Using the tables in the textbook:  

$$P(6 \leq Y \leq 9) = P(Y \leq 9) - P(Y \leq 5)$$

$$= 0.8305 - 0.3007 = 0.5298$$
- 10** Let  $X$  be the number of tomato plants growing over 2 metres in a sample of 50. Then  $X \sim B(50, 0.08)$  and this can be approximated by  $X \sim \text{Po}(50 \times 0.08)$ , i.e.  $X \sim \text{Po}(4)$   
 Using the tables in the textbook:  

$$P(5 \leq X \leq 8) = P(X \leq 8) - P(X \leq 4)$$

$$= 0.9786 - 0.6288 = 0.3498$$
- 11 a** Let  $X$  be the number of damaged genes in an insect cell. Assuming genes are damaged independently,  $X \sim B(1200, 0.005)$
- b**  $E(X) = np = 1200 \times 0.005 = 6$   
 $\text{Var}(X) = np(1-p) = 1200 \times 0.005 \times 0.995 = 5.97$
- c** Use the approximation  $X \sim \text{Po}(1200 \times 0.005)$ , i.e.  $X \sim \text{Po}(6)$   
 Using the tables in the textbook:  

$$P(X \leq 4) = 0.2851$$
- 12 a** Let  $X$  be the number of defective nails in a sample of 200. Then  $X \sim B(200, 0.025)$  and this can be approximated by  $X \sim \text{Po}(200 \times 0.025)$ , i.e.  $X \sim \text{Po}(5)$   
 Using the tables in the textbook:  

$$P(X > 6) = 1 - P(X \leq 6)$$

$$= 1 - 0.7622 = 0.2378$$
- b** Let  $Y$  be the number of packets with more than 6 defective nails in a sample of 6 packets. Then  $Y \sim B(6, 0.2378)$ .  
 Using a calculator:  

$$P(Y > 3) = 1 - P(X \leq 3)$$

$$= 1 - 0.9685 = 0.0315 \text{ (4 d.p.)}$$
- 13 a** Let  $X$  be the number of defective components in a sample of 400. Then  $X \sim B(400, 0.0125)$  and this can be approximated by  $X \sim \text{Po}(400 \times 0.0125)$ , i.e.  $X \sim \text{Po}(5)$   
 Using the tables in the textbook:  

$$P(X > 3) = 1 - P(X \leq 3)$$

$$= 1 - 0.2650 = 0.7350$$
- b** Let  $Y$  be the number of boxes containing more than 3 defective components in a sample of 5. Then  $Y \sim B(5, 0.7350)$   

$$P(Y = 3) = \binom{5}{3} \times (0.735)^3 \times (0.265)^2 = 0.2788 \text{ (4 d.p.)}$$

- 14 a** Let  $X$  be the number of 1st class letters arriving next day in a sample of 180. Then  $Y = 180 - X$  is the number of 1st class letters failing to arrive next day. Then  $Y \sim B(180, 0.05)$  and this can be approximated by  $Y \sim \text{Po}(180 \times 0.05)$ , i.e.  $Y \sim \text{Po}(9)$

Using the tables in the textbook:

$$P(X > 173) = P(Y \leq 6) = 0.2068$$

- b**  $P(X < 168) = P(Y > 12) = 1 - P(Y \leq 12)$   
 $= 1 - 0.8758 = 0.1242$

- 15 a** Let  $X$  be the number of broken eggs in a sample of 150. Then  $X \sim B(150, 0.01)$  and this can be approximated by  $X \sim \text{Po}(150 \times 0.01)$ , i.e.  $X \sim \text{Po}(1.5)$

Using the tables in the textbook:

$$P(X > 4) = 1 - P(X \leq 4)$$

$$= 1 - 0.9814 = 0.0186$$

- b** Let  $Y$  be the number of consignments containing more than 4 broken eggs in a sample of 5. Then  $Y \sim B(5, 0.0186)$

$$P(Y = 1) = \binom{5}{1} \times (0.0186)^1 \times (0.9814)^4 = 0.0863 \text{ (4 d.p.)}$$
